

That error is **not your app logic** breaking — it's almost certainly a **browser extension injecting attributes into `<body>` before React hydrates**.

In your screenshot, React is literally pointing at attributes like:

- `data-new-gr-c-s-check-loaded="..."`
- `data-gr-ext-installed=""`

Those are injected by **Grammarly** (and similar extensions). React then says: “server HTML didn't have these attributes, client does → hydration mismatch.”

Fix (admin-friendly, production-safe)

✅ Step 1 — Add `suppressHydrationWarning` to your root layout

Open:

`src/app/layout.tsx`

Change it to this:

```
import './globals.css';
import Navbar from '@components/Navbar';

export const metadata = {
  title: 'OKÜ Group Platform',
  description: 'Commercial + IR + HR + Connectivity Hub',
};

export default function RootLayout({ children }: { children: React.ReactNode }) {
  return (
    <html lang="en" suppressHydrationWarning>
      <body suppressHydrationWarning style={{ background: '#fafafa', color: '#111' }}>
        <Navbar />
        <main style={{ maxWidth: 1100, margin: '0 auto', padding: 16 }}>{children}</main>
      </body>
    </html>
  );
}
```

This tells React: “**ignore small server/client attribute differences**” (exactly what extensions cause).

✓ Step 2 — Test without extensions (to confirm)

Do **one** of these:

- Open the Replit preview in **Incognito/Private Window**
- Or disable Grammarly extension for the Replit domain

If the warning disappears, that’s your confirmation.

Additional improvement (prevents a *different* hydration mismatch later)

If/when you render dates inside **client components**, `toLocaleString()` can cause mismatches across server vs client timezones/locales.

In your `series/[slug]/page.tsx`, you currently do:

```
new Date(sess.startsAt).toLocaleString()
```

That is fine in a server component today, but if you later move it into a client component, it can cause hydration warnings.

Scalable-safe approach: format dates with an explicit timezone:

```
new Intl.DateTimeFormat("en-US", {  
  dateStyle: "medium",  
  timeStyle: "short",  
  timeZone: "UTC",  
}).format(new Date(sess.startsAt))
```

(You can later replace UTC with venue timezone.)

Bottom line

- ✓ The quickest fix is adding `suppressHydrationWarning` to `<html>` + `<body>`.
- ✓ The root cause is **Grammarly injecting DOM attributes**.
- ✓ Incognito test will prove it immediately.
